

Create a script that checks whether the current system version is the latest one or not.

In Linux, to check your version, you must type `lsb_release -r`

```
profesor@profesor-VirtualBox:~$ lsb_release -r  
Release:      20.04
```

How the script will work?

The script must receive an argument from command line which is the latest release.

If the version provided is the same as the one returned by the command, then it will print: "OK. No update is needed".

If the version is different, then it will print: "You must update your system".

🔧 **Challenge 1:** transform the script into a function.
